

REO [REMOTE EGG OILING]

Nesting season shouldn't stop your operations.

One treatment. A whole season of protection.

OrniLogic pioneered Remote Egg Oiling (REO), bringing a well-established management technique into the drone age. Our patented Remote Fluid Application System (RFAS) has been in the field for a decade, with a proven record of safety and efficacy protecting client assets on energized transmission and distribution lines, crane booms, and other hard-to-reach locations that ground crews simply cannot access.

A single treatment is applied with a small amount of silicone fluid during the incubation period. This action renders the nest inactive while posing no risk to personnel or sensitive equipment.

Operated by our expert pilots, our American-made, NDAA-compliant drone platform ensures safe operation and completes most oiling flights in 1 to 5 minutes.
